ABSTRACT

This project is an Ecommerce system that has three different user types, each user type has different modules and features. The supplier user has module that can add a product to the system, edit its features such as the name, description, price, images, and stocks, supplier can also delete a product that to the system. The other two modules, which is the retailer, and the reseller also have the same features. Retailer users will also buy products from the supplier. Lastly the reseller can also produce from the retailer that the retailer bought from the supplier. Each module has Dashboard, View inventory, Manage Products, and profile. The system also has a PayPal and google login integration.

Chapter 1

THE PROJECT DESCRIPTION

Project Description

Our system was created to make it easier for suppliers, resellers, and retailers to distribute shoes. It has modules for handling sales, orders, and stock levels in addition to a monitoring system that offers detailed data and an overview of operations. The system provides suppliers with an intuitive interface via which they can oversee orders, add new shoe goods, and examine transaction histories. Suppliers may also check stock levels and allocate resources optimally to make sure they can properly satisfy demand.

The retailer system has a capability to monitor order history, a dashboard that gives an overview of operations, and tools for managing current orders. This keeps merchants informed and well-organized. The reseller system provides capabilities like order management, landing pages, a shopping cart, a fast checkout procedure, and order history capabilities. This user-friendly setup simplifies the purchasing process for resellers, making it easy for them to manage their business operations efficiently.

SYSTEM ARCHITECTURE DESIGN

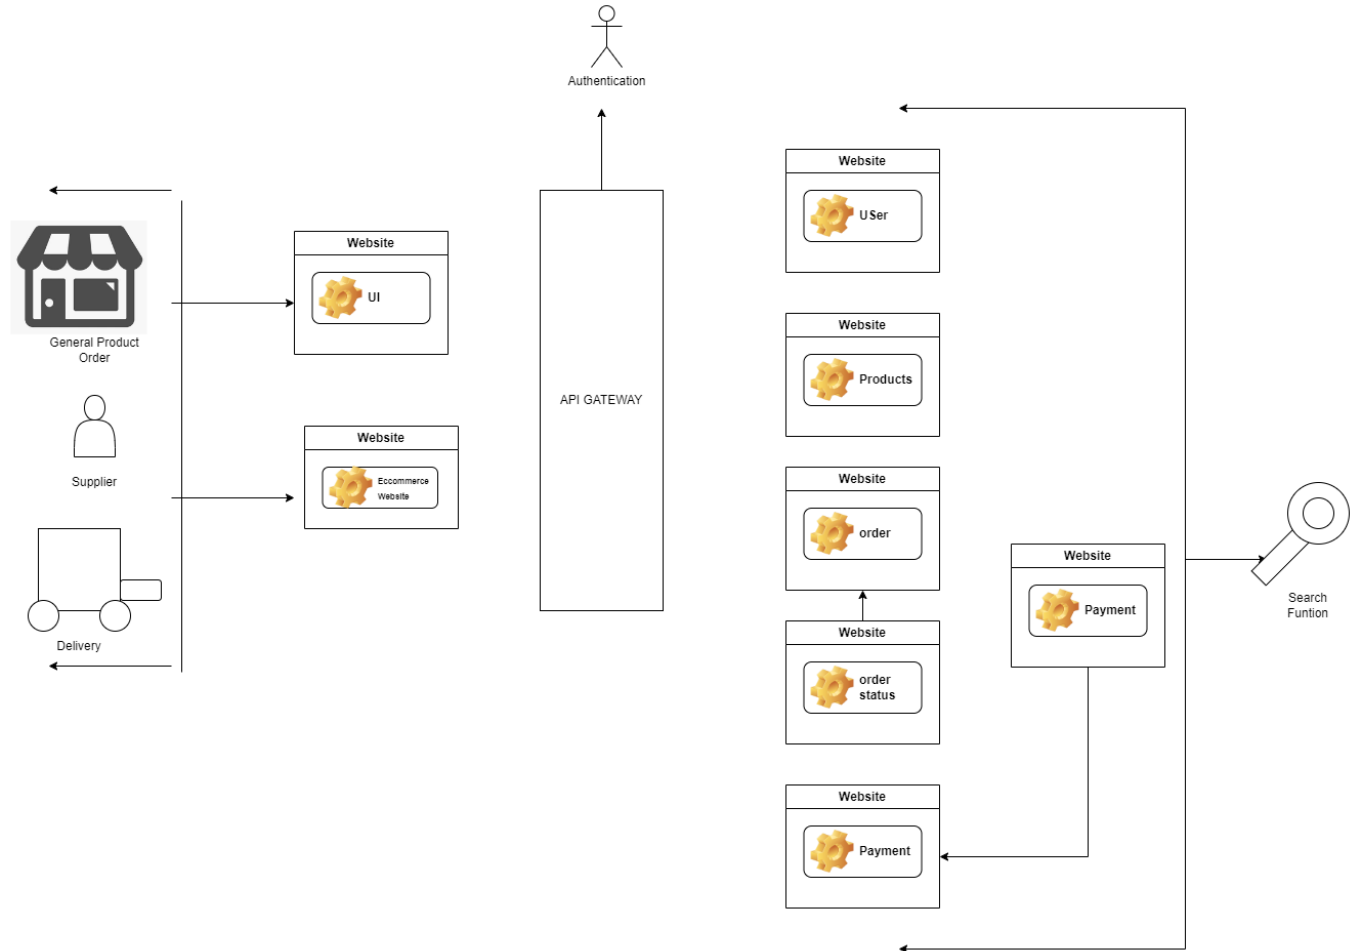

Figure 4. System Architecture Design

In our system architecture, we implemented an API-based integration strategy using REST (Representational State Transfer) APIs to ensure seamless communication and data exchange among suppliers, resellers, and retailers. This RESTful approach leverages a stateless, client-server model. By adopting REST APIs, we provide a scalable, flexible, and easy-to-integrate solution that supports a wide range of operations, from adding new products and managing orders to retrieving transaction histories and optimizing resource allocation, all while ensuring interoperability across different systems and platforms.
