Assuming you are the Systems Administrator of a certain company from Business Process Outsourcing (BP); Banking and Finance; and Telecommunication that would like to implement its either NAS or Cloud computing?

Recommendation:

If I was the system administrator of a big company of a Business Process Outsourcing, Banking and Finance, and Telecommunication I would assume that these companies have big budget to these types of things, I would recommend implementing a hybrid implementation using both NAS and cloud storage together, rather than choosing one. Hybrid model offers the best of both worlds and addresses many of the limitations of each individual solution.

Cloud storage provides better scalability, remote access capabilities, and built-in redundancy. It's ideal for storing large amounts of data that may change frequently. NAS offers faster local access speeds, better control over data, and lower upfront costs. It's well-suited for files that don't change that often. Also, since all of these industries have sensitive data, its better to use NAS rather than cloud storage so that you can have better control over it and you have it physically unlike cloud where you only have it in the internet.

Implementation Suggestion:

In the implementation phase, I suggest testing both cloud storage and NAS to see which works best for the organization's needs. By running these tests side by side, you see how each system performs in terms of speed, security, and accessibility. For deployment I

recommend using cloud computing because it's faster to set up, highly scalable, and easier to use. To make deployment even smoother. When it comes to maintenance, a hybrid approach is good. Use NAS for sensitive and critical data that require more control and local management, while cloud storage can handle general data with its automated updates, backups, and remote access capabilities. It's also better to add backup and redundancy strategy like keeping essential backups on both NAS and the cloud.

Advantages and Disadvantages

1. Sharing

- **Advantages:**

- NAS:**

- Great for sharing files within the office or on a local network.

- File transfers are fast since they don't depend on the internet.

- Cloud Computing:**

- Makes it easy to share files with anyone, anywhere, especially for remote teams.

- Allows real-time collaboration, like multiple people editing documents at once.

- **Disadvantages:**

- NAS:**

- Sharing files with remote teams can be tricky unless you set up things like a VPN, which takes extra effort.

- Cloud Computing:**

- Sharing relies on a good internet connection. If the internet goes down, sharing stops.

2. Access

- Advantages:**

- NAS:**

- Works quickly and reliably inside your office network.

You have full control over who can access the files.

Cloud Computing:

You can access your files from anywhere, whether you're at home, in the office, or on the go.

Works smoothly with phones, tablets, and other devices.

- **Disadvantages:**

NAS:

Accessing files remotely can be complicated and requires special setups.

Cloud Computing:

Slower access if your internet connection is weak or overloaded.

3. Security

- **Advantages:**

NAS:

Your files are stored on-site, so you have complete control over them.

It's good for sensitive information like financial data.

Cloud Computing:

Comes with built-in security features like encryption and two-factor authentication.

The cloud provider handles regular updates to keep your data safe.

- **Disadvantages:**

NAS:

You're responsible for keeping the system secure, which can be a challenge if you don't have a dedicated IT team.

If the hardware fails, your files could be at risk unless you have backups.

Cloud Computing:

There's always the risk of data breaches since files are stored on shared servers.

Some industries require extra steps to make sure cloud storage complies with strict rules (like for banking data).

4. Cost

- **Advantages:**

NAS:

It's a one-time investment for the hardware, which is great for small businesses with predictable needs.

Cloud Computing:

Pay-as-you-go pricing means you only pay for what you use. No upfront costs for hardware, making it easier to get started.

- **Disadvantages:**

NAS:

Buying hardware can be expensive upfront, and you'll need to spend on upgrades and maintenance later.

Cloud Computing:

Monthly or yearly subscription fees can add up over time, especially for businesses storing lots of data.
